Hiring Manager
Asana

I am applying for the Solutions Engineer position in your New York office. My background in systems engineering, SaaS development, and enterprise IT operations positions me well to guide prospects through ROI-driven conversations, deliver tailored demonstrations, and ensure that Asana's value is directly mapped to customer outcomes.

In my current role at Continental Stock Transfer and Trust, I manage enterprise infrastructure while also building internal applications and automation pipelines in Python, Docker, and AWS. I have led migrations from legacy platforms into SaaS-based systems, implemented compliance-driven workflows, and designed dashboards that improved company-wide visibility into operational processes. Each of these projects required deep discovery with stakeholders, translating business challenges into technical solutions, and presenting outcomes that connected directly to business goals—skills that mirror Asana's customer-centric approach to solution engineering.

Earlier, as a QA Engineer at OpenCrowd, I built automated testing frameworks and validated API-driven SaaS applications in high-stakes financial and cybersecurity environments. At Iterative Capital, I contributed to the development of a real-time trading platform, integrating APIs and implementing secure authentication workflows. Across these roles, I consistently partnered with cross-functional teams—product, engineering, and customer-facing stakeholders—to deliver solutions that solved complex challenges under tight deadlines.

I have experience mapping business processes, building workflow automation, and presenting technical solutions to both executives and end-users. My background in SaaS environments and strong customer-facing skills give me the ability to not only articulate Asana's value but also design repeatable workflows that scale across industries. I am also deeply curious about emerging technologies, particularly AI-driven productivity tools, and am motivated to apply them to enhance customer adoption and ROI.

I look forward to the opportunity to discuss how my technical expertise and customer engagement skills can support Asana's mission to help teams achieve their most important goals, faster.

Thank you for your attention. I look forward to the opportunity to speak further.

Best Regards,

Jordan Scott
