Hiring Manager

Code and Theory

I am applying for the Machine team role at Code and Theory because it sits at the intersection of areas where I consistently deliver value: building reliable production systems, translating complex requirements into maintainable software, and supporting high-performance workflows in demanding enterprise environments.

My background is in designing, deploying, and operating backend services and infrastructure in financial services and enterprise contexts, where compliance, security, and visibility are non-negotiable. I work primarily in Python, building APIs, automation, and data-driven systems that support critical internal and external workflows. Much of my day-to-day work involves designing cloud-native services (and a few on prem legacy products), maintaining CI/CD pipelines, and improving system performance and reliability under real operational constraints.

While my experience is rooted in systems and backend engineering, I have increasingly focused on AI-enabled platforms and service integrations, supporting data pipelines, orchestration layers, and tooling that allow teams to safely adopt new capabilities without sacrificing stability or performance. I am comfortable collaborating across disciplines, working closely with product managers, operations, and finance teams to turn ambiguous or evolving requirements into production-ready software.

I am particularly drawn to the Machine team's emphasis on balancing innovation with real-world constraints. I care deeply about software quality, accessibility, and performance, and I take ownership of the systems I build, whether that means identifying bottlenecks, improving developer ergonomics, or raising the bar through code review and shared standards. I enjoy environments where technical decisions matter, tradeoffs are explicit, and engineers are expected to think beyond isolated features.

I would bring to this role a strong foundation in backend architecture, data processing, and cloud operations, along with the curiosity and discipline required to work in fast-moving AI-driven systems. I am motivated by building platforms that empower others to move quickly without breaking trust, performance, or maintainability.

Thank you for your time and consideration. I would welcome the opportunity to discuss how my experience aligns with the needs of your team.

Best Regards,

Jordan Scott
