**Hiring Manager
monday.com**

I am applying for the Solution Engineer position on the NYC team. My background in systems engineering, SaaS development, and enterprise IT equips me with the technical depth, customer-facing experience, and problem-solving skills required to help monday prospects understand the platform's value and ensure successful adoption.

At Continental Stock Transfer and Trust, I manage enterprise infrastructure while building internal applications and automation pipelines using Python, React, Docker, and AWS. I led multiple migrations from legacy recordkeeping systems into SaaS-driven platforms, automated compliance reporting workflows, and implemented process visibility tools that streamlined company-wide operations. These initiatives required mapping complex business processes, presenting solutions to non-technical stakeholders, and delivering reliable implementations—skills directly aligned with pre-sales engineering.

Previously, as a QA Engineer at OpenCrowd, I validated SaaS and cybersecurity platforms through automated testing frameworks, REST API validation, and performance testing in AWS environments. Earlier at Iterative Capital, I built and integrated APIs for real-time trading platforms, contributing to both customer-facing features and backend infrastructure. Across these roles, I learned how to translate customer requirements into actionable technical solutions, handle objections with clarity, and ensure that proposed solutions aligned with both business and technical needs.

I have hands-on experience with RESTful APIs, JSON-based integrations, and SaaS workflows, with additional exposure to GraphQL. My ability to communicate technical concepts clearly to non-technical audiences, combined with strong teamwork and customer engagement skills, makes me well-suited to support monday's sales processes, establish pre-configured solution packages, and drive strategic opportunities.

I am motivated by the chance to help prospects see how monday can transform their workflows, and I look forward to contributing to the growth of the NYC sales engineering team.

Thank you for your attention. I look forward to the opportunity to speak further.

Best Regards,

Jordan Scott
